1. The Linear Regression Procedure and the Statistical Analysis

The Linear Regression and the calculation of $\overline{GAV/NNI}$ vector

As described in the text, a thermochemical property (y) of a radical is calculated through additivity of the values of GAV and NNI parameters based on how many times they occur in that radical. This leads to the following equation:

$$\sum_{i=1}^n X_i \beta_i = y \quad (1)$$

where X_i is the number of occurrence of the parameter i in the radical and β_i is the value of the i^{th} parameter, which is calculated through the linear regression procedure. For each radical j , $\sum_{i=1}^n X_{ij} \beta_i$ is equal to $\hat{y}_j$, which is the group additively calculated thermochemical data of the radical whereas y_j represents the G4/BAC based thermochemical data for j .

Once Eq. 1 is written for all the m number of radicals, an overdetermined system of linear equations is obtained:

$$\sum_{j=1}^m X_{ij} \beta_i = y_j \quad (i=1,2,\dots,n) \quad (2)$$

Here, X_{ij} is the occurrence matrix which carries the information on how many times each of the parameters occur in each of the radicals and it has the dimensions of $m \times n$.

Least-squares linear regression is carried out to solve this system of equations and obtain β_i vector, which contains the GAV/NNI parameters.

The difference between y_j and $\hat{y}_j$ can be called as "residual", as given in Eq. 3.

$$r_j = y_j - \sum_{i=1}^n X_{ij} \beta_i \quad (3)$$

and the sum of the square of these residuals (SSQ) are given in Eq. 4.

$$SSQ = \sum_{j=1}^m (y_j - \hat{y}_j)^2 \quad (4)$$

The objective function SSQ, i.e. the square root of the difference between ab-initio data and the GA predictions with respect to the GAV/NNI parameters, β is minimized (argmin (SSQ)).

$$\frac{\partial SSQ}{\partial \beta} = 0 \quad (5)$$

This minimization yields the following equation:

$$(X^T X) \bar{\beta} = X^T \bar{y} \quad (6)$$

The expression in Eq. 6 can be rearranged to the following equation that yields $\bar{\beta}$, which is the $\overline{GAV/NNI}$ vector given in Eq. 15 of the text:

$$\overline{GAV/NNI} = (X^T X)^{-1} X^T \bar{y} \quad (7)$$

Since, the occurrence matrix and the $\bar{y}$ vector, which contains the G4/BAC calculated thermochemical data are available, $\overline{GAV/NNI}$ vector can easily be calculated from Eq. 7 above. The $(X^T X)^{-1}$ matrix is separately calculated since it is needed for the calculation of confidence intervals, as explained below.

Calculation of Uncertainty of Parameters

First, mean squared errors (MSE) are calculated using SSQ and the degrees of freedom:

$$MSE = \frac{SSQ}{n_{molecules} - n_{parameters}} \quad (8)$$

MSE includes the variance of the residuals and the errors due to bias, i.e. systematic errors.

$$MSE = \sigma^2 + \text{Bias}^2 \quad (9)$$

These confidence intervals represent uncertainties only due to statistical errors. Several systematic sources of error exists, as explained in the text, they are not taken into consideration in this study and hence, the MSE is assumed to be equal to only σ^2 .

Then, the variance-covariance matrix of parameters is calculated from the following equation:

$$\sum_{ij} Cov(X_i, X_j) = (X^T X)^{-1} * \sigma^2 \quad (10)$$

The diagonal of the covariance-variance matrix ($Cov(X_i, X_j)$) contains variances of the parameters, whereas the covariances of the parameters are obtained from the off-diagonals of this matrix.

The square root of the diagonal elements of the covariance-variance matrix, i.e. the standard deviations on the parameters, are used to calculate the confidence interval (CI_i) at 97.5% confidence level ($t_{97.5}$) of the i^{th} parameter.

$$CI_i = t_{97.5,i} * \sqrt{Cov(X_i, X_i)} \quad (11)$$

The final GAV and NNI parameters are reported with their uncertainties ($\beta_i \pm CI_i$) in Table 4 and 5, respectively.

2. List of Radicals

In this section of the Supporting Information, all the 389 radicals that appear in various sections of the article are listed.

Out of 389 radicals that appear in the article, 369 of them are monocyclic aromatic radicals (MARs) which are used for the development of GAV/NNI parameters, whereas the other 20 radicals are excluded due to the reasons described in the manuscript. The MARs within the framework of this study include unsubstituted and substituted phenyls ($C_6H_5\bullet$), phenoxies ($C_6H_5O\bullet$), anisyls ($C_6H_5OCH_2\bullet$), benzoyls ($C_6H_5C\bullet=O$), β -trans-styryls ($t-C_6H_5CH=CH\bullet$), β -cis-styryls ($c-C_6H_5CH=CH\bullet$), benzyls ($C_6H_5CH_2\bullet$) and α -methylbenzyls ($C_6H_5CH\bullet CH_3$).

These radicals are listed in three different sets: training set (**T**), validation set (**V**) and special cases set (**S**). Training set (**T**) includes 316 MARs that are used in the simultaneous determination of the preliminary Group Additive Values (GAVs) and non-nearest neighbor interactions (NNIs). Validation set (**V**) is used in order to test the applicability of the obtained GAVs and NNIs for the radicals that are outside the training set and this set encompasses 53 MARs. As described in the article, the final determination of these parameters are realized through the optimization of GAVs/NNIs based on the final set of 369 MARs which is formed via combination of training and validation sets. Special cases set (**S**) includes the set of 20 radicals that are excluded from the Group Additivity parameter development sets due to the reasons described in the article.

Each of these radical classes are listed in different subsets and the numbering of the radicals are based on these subset definitions. The number that corresponds to the n^{th} radical in m^{th} subset in the training set is given as "**Tm/n**", e.g. 21st radical in phenyl subset (1st subset) in the training set is numbered as **T1/21**. Six subsets exist in both training and test sets. These subsets are given in the following order: phenyl, phenoxy, anisyl, benzoyl, styryl and benzyl. Representations of the MARs in each of these subsets are given in the following subsections (**Figures S1-S14**) above the numbers and the abbreviations of the names of the corresponding MARs. In the list of molecules of the training set (**T**), these abbreviations are explained in each subsection for each subset with one example. In the validation set (**V**), the abbreviation of the radical names and the numbering method is the same, except that the numbering starts with "**V**" instead of "**T**".

In the substituted MARs of interest, the substituent groups are hydroxy (-OH), methoxy (-OCH₃), formyl (-CHO), vinyl (-CH=CH₂), methyl (-CH₃) and ethyl (-CH₂CH₃).

2.1 Training Set

2.1.1 Phenyl Subset

In the phenyl subset, there are 23 MARs. This subset of MARs include unsubstituted phenyl, 18 single substituted phenyls, 3 double substituted phenyls and 1 triple substituted phenyl. In the names given below, " $C_6H_5\bullet$ " refers to phenyl radical and single substituted phenyls are given as $XC_6H_4\bullet$ where X=-H, -OH, -OCH₃, -CHO, -CH=CH₂, -CH₃ or -CH₂CH₃. For instance, ortho hydroxy substituted phenyl (MAR no. **T1/2**) is abbreviated as o-OHC₆H₄•.

In double and triple substituted phenyls, the location of the radical site on the aryl ring is given as “C•”, e.g. 1-C•-2-OH-3-OCH₃-5-CHO (MAR no. **T1/23**) represents 2-hydroxy-3-methoxy-5-formylphenyl.

Figure S1. List of radicals in phenyl subset of the training set.

2.1.2 Anisyl Subset

There are 33 MARs in the “anisyl” subset of the training set of MARs which is composed of anisyl, 18 double substituted, 14 triple substituted anisyls. “C₆H₅OCH₂•” refers to anisyl radical and double substituted anisyls are given as (X)C₆H₄OCH₂• where X=-OH, -OCH₃, -CHO, -CH=CH₂, -CH₃ or -CH₂CH₃. For instance, ortho hydroxy substituted anisyl (MAR no. **T2/2**) is abbreviated as o-OHC₆H₄OCH₂•.

In triple substituted anisyls, “OCH₂•” is used to indicate radical substituent group. As an example; 2-hydroxy-5-vinylanisyl (MAR no. **T2/24**) is abbreviated as 1-OCH₂•-2-OH-5-CH=CH₂.

T2/1- $\text{C}_6\text{H}_5\text{OCH}_2\bullet$ **T2/2-** $\text{o}-(\text{OH})\text{C}_6\text{H}_4\text{OCH}_2\bullet$ **T2/3-** $\text{m}-(\text{OH})\text{C}_6\text{H}_4\text{OCH}_2\bullet$ **T2/4-** $\text{p}-(\text{OH})\text{C}_6\text{H}_4\text{OCH}_2\bullet$ **T2/5-** $\text{o}-(\text{OCH}_3)\text{C}_6\text{H}_4\text{OCH}_2\bullet$ **T2/6-** $\text{m}-(\text{OCH}_3)\text{C}_6\text{H}_4\text{OCH}_2\bullet$

T2/7- $\text{p}-(\text{OCH}_3)\text{C}_6\text{H}_4\text{OCH}_2\bullet$ **T2/8-** $\text{o}-(\text{CHO})\text{C}_6\text{H}_4\text{OCH}_2\bullet$ **T2/9-** $\text{m}-(\text{CHO})\text{C}_6\text{H}_4\text{OCH}_2\bullet$ **T2/10-** $\text{p}-(\text{CHO})\text{C}_6\text{H}_4\text{OCH}_2\bullet$ **T2/11-** $\text{o}-(\text{CH}=\text{CH}_2)\text{C}_6\text{H}_4\text{OCH}_2\bullet$

T2/12- $\text{m}-(\text{CH}=\text{CH}_2)\text{C}_6\text{H}_4\text{OCH}_2\bullet$ **T2/13-** $\text{p}-(\text{CH}=\text{CH}_2)\text{C}_6\text{H}_4\text{OCH}_2\bullet$ **T2/14-** $\text{o}-(\text{CH}_3)\text{C}_6\text{H}_4\text{OCH}_2\bullet$ **T2/15-** $\text{m}-(\text{CH}_3)\text{C}_6\text{H}_4\text{OCH}_2\bullet$ **T2/16-** $\text{p}-(\text{CH}_3)\text{C}_6\text{H}_4\text{OCH}_2\bullet$

T2/17- $\text{o}-(\text{CH}_2\text{CH}_3)\text{C}_6\text{H}_4\text{OCH}_2\bullet$ **T2/18-** $\text{m}-(\text{CH}_2\text{CH}_3)\text{C}_6\text{H}_4\text{OCH}_2\bullet$ **T2/19-** $\text{p}-(\text{CH}_2\text{CH}_3)\text{C}_6\text{H}_4\text{OCH}_2\bullet$ **T2/20-** $1-\text{OCH}_2\bullet-3,4-\text{OH}$ **T2/21-** $1-\text{OCH}_2\bullet-2-\text{OH}-6-\text{OCH}_3$

T2/22- $1-\text{OCH}_2\bullet-2-\text{OH}-4-\text{CHO}$ **T2/23-** $1-\text{OCH}_2\bullet-2-\text{OH}-5-\text{CHO}$ **T2/24-** $1-\text{OCH}_2\bullet-2-\text{OH}-5-\text{CH}=\text{CH}_2$ **T2/25-** $1-\text{OCH}_2\bullet-2-\text{OCH}_3-4-\text{OH}$ **T2/26-** $1-\text{OCH}_2\bullet-2-\text{OCH}_3-6-\text{OH}$

Figure S2. List of radicals in anisyl subset of the training set.

2.1.3 Phenoxy Subset

There are 68 MARs in the “phenoxy” subset of the training set of MARs which is composed of phenoxy, 18 double, 47 triple and 2 quadruple phenoxyes. “C₆H₅O•” refers to phenoxy radical and double substituted phenoxyes are given as (X)C₆H₄O• where X=-OH, -OCH₃, -CHO, -CH=CH₂, -CH₃ or -CH₂CH₃. For instance, ortho hydroxy substituted phenoxy (MAR no. **T3/2**) is abbreviated as o-OHC₆H₄O•.

In multiple (triple and quadruple) substituted phenoxyes, “O•” is used to indicate oxygen substituent with radical center. As an example; 2-formyl-4-methylphenoxy (MAR no. **T3/59**) is abbreviated as 1-O•-2-CHO-4-CH₃.

T3/14-o-(CH₃)C₆H₄O• **T3/15**-m-(CH₃)C₆H₄O• **T3/16**-p-(CH₃)C₆H₄O• **T3/17**-o-(CH₂CH₃)C₆H₄O• **T3/18**-m-(CH₂CH₃)C₆H₄O• **T3/19**-p-(CH₂CH₃)C₆H₄O•

T3/20-1-O•-2,3-OH **T3/21**-1-O•-3,4-OH **T3/22**-1-O•-2-OH-4-OCH₃ **T3/23**-1-O•-2-OH-6-OCH₃ **T3/24**-1-O•-2-OH-3-CHO

T3/25-1-O•-2-OH-4-CHO **T3/26**-1-O•-2-OH-6-CHO **T3/27**-1-O•-2-OH-4-CH=CH₂ **T3/28**-1-O•-2-OH-5-CH=CH₂ **T3/29**-1-O•-2-OH-6-CH=CH₂

T2/30-1-O•-2-OH-4-CH₃ **T2/31**-1-O•-2-OH-5-CH₃ **T2/32**-1-O•-2-OH-6-CH₃ **T3/33**-1-O•-2-OCH₃-3-OH **T3/34**-1-O•-3-OCH₃-4-OH

T3/35-1-O•-2,3-OCH₃ **T3/36**-1-O•-2,6-OCH₃ **T3/37**-1-O•-3,4-OCH₃ **T3/38**-1-O•-2-OCH₃-3-CHO **T3/39**-1-O•-2-OCH₃-4-CHO

T3/40-1-O•-2-OCH₃-6-CHO **T3/41**-1-O•-2-OCH₃-3-CH=CH₂ **T3/42**-1-O•-2-OCH₃-4-CH=CH₂ **T3/43**-1-O•-2-OCH₃-3-CH₃

Figure S3. List of radicals in phenoxy subset of the training set.

2.1.4 Benzoyl Subset

There are 42 MARs in the “benzoyl” subset of the training set of MARs which is composed of benzoyl, 18 double substituted and 23 triple substituted benzoyls. “C₆H₅C•=O” refers to benzoyl radical and

double substituted benzoyls are given as $(X)C_6H_4C\bullet=O$ where $X=-OH, -OCH_3, -CHO, -CH=CH_2, -CH_3$ or $-CH_2CH_3$. For instance, ortho hydroxy substituted benzoyl (MAR no. **T4/2**) is abbreviated as $o-OHC_6H_4C\bullet=O$.

In triple substituted benzoyls, " $C\bullet=O$ " is used to indicate radical substituent group. As an example; 3-hydroxy-4-vinylbenzoyl (MAR no. **T4/25**) is abbreviated as $1-C\bullet=O-3-OH-4-CH=CH_2$.

T4/1- $C_6H_5C\bullet=O$ **T4/2**- $o-(OH)C_6H_4C\bullet=O$ **T4/3**- $m-(OH)C_6H_4C\bullet=O$ **T4/4**- $p-(OH)C_6H_4C\bullet=O$ **T4/5**- $o-(OCH_3)C_6H_4C\bullet=O$ **T4/6**- $m-(OCH_3)C_6H_4C\bullet=O$

T4/7- $p-(OCH_3)C_6H_4C\bullet=O$ **T4/8**- $m-(CHO)C_6H_4C\bullet=O$ **T4/9**- $p-(CHO)C_6H_4C\bullet=O$ **T4/10**- $o-(CH=CH_2)C_6H_4C\bullet=O$ **T4/11**- $m-(CH=CH_2)C_6H_4C\bullet=O$

T4/18- $p-(CH_2CH_3)C_6H_4C\bullet=O$ **T4/19**- $1-C\bullet=O-2,3-OH$ **T4/20**- $1-C\bullet=O-2,5-OH$ **T4/21**- $1-C\bullet=O-3,4-OH$ **T4/22**- $1-C\bullet=O-2-OH-6-OCH_3$

Figure S4. List of radicals in benzoyl subset of the training set.

2.1.5 β -Styryl Subset

There are 80 styryls in this subset of the training set of MARs which is composed of 38 unsubstituted and substituted trans- β -styryls and 42 unsubstituted and substituted cis- β -styryls. “t-C₆H₅CH=CH•” and “c-C₆H₅CH=CH•” refers to trans- β -styryl and cis- β -styryl radicals, respectively. The names of the double substituted radicals of trans- β -styryls and cis- β -styryls are given as (X)t-C₆H₅CH=CH• and (X)c-

$C_6H_5CH=CH\bullet$, respectively where $X=-OH, -OCH_3, -CHO, -CH=CH_2, -CH_3$ or $-CH_2CH_3$. For instance, ortho hydroxy substituted trans- β -styryl (MAR no. **T5/2**) is abbreviated as o-(OH)t- $C_6H_4CH=CH\bullet$.

In triple substituted styryls, "t- $CH=CH\bullet$ " and "c- $CH=CH\bullet$ " represents the trans and cis radical vinyl groups, respectively. As an example; 2-hydroxy-5-vinyl trans- β -styryl (MAR no. **T5/25**) is abbreviated as 1-(t- $CH=CH\bullet$)-2-OH-5- $CH=CH_2$.

T5/1-t- $C_6H_5CH=CH\bullet$ **T5/2**-o-(OH)t- $C_6H_4CH=CH\bullet$ **T5/3**-m-(OH)t- $C_6H_4CH=CH\bullet$ **T5/4**-p-(OH)t- $C_6H_4CH=CH\bullet$ **T5/5**-o-(OCH_3)t- $C_6H_4CH=CH\bullet$

2.1.6 Benzyl/1-Phenylethyl Subset

There are 70 MARs in the “benzyl” subset of the training set of MARs which is composed of benzyl, α -methylbenzyl, 18 double substituted, 32 triple substituted benzyls and 18 double substituted α -methylbenzyls. “ $C_6H_5CH_2\bullet$ ” and “ $C_6H_5CH\bullet CH_3$ ” refers to benzyl and α -methylbenzyl radicals, respectively. Double substituted benzyls and α -methylbenzyls are given as $(X)C_6H_4CH_2\bullet$ and $(X)C_6H_4CH\bullet CH_3$, respectively where $X = -OH, -OCH_3, -CHO, -CH=CH_2, -CH_3$ or $-CH_2CH_3$. For instance, ortho hydroxy substituted benzyl (MAR no. **6/2**) is abbreviated as o- $OHC_6H_4CH_2\bullet$.

In triple substituted benzyls, “ $CH_2\bullet$ ” is used to indicate radical substituent group. As an example; 2,4-dihydroxybenzyl (MAR no. **6/21**) is abbreviated as 1- $CH_2\bullet$ -2,4-OH. There are no triple substituted α -methylbenzyls in the database.

T6/1- $C_6H_5CH_2\bullet$ **T6/2**-o-(OH) $C_6H_4CH_2\bullet$ **T6/3**-m-(OH) $C_6H_4CH_2\bullet$ **T6/4**-p-(OH) $C_6H_4CH_2\bullet$ **T6/5**-o-(OCH₃) $C_6H_4CH_2\bullet$ **T6/6**-m-(OCH₃) $C_6H_4CH_2\bullet$

Figure S7. List of radicals in benzyl subset of the training set.

2.2 Validation Set

Validation set encompasses 53 MARs. This set of MARs include 2 phenyls (C₆H₅•), 12 phenoxies (C₆H₅O•), 5 anisyls (C₆H₅OCH₂•), 9 benzoyls (C₆H₅C•=O), 7 β-trans-styryls (t-C₆H₅CH=CH•), 8 β-cis-styryls (c-C₆H₅CH=CH•), 9 benzyls (C₆H₅CH₂•) and 1 α-methylbenzyl (C₆H₅CH•CH₃). Similar to the training set, these radicals are grouped into six subsets; namely phenyl, phenoxy, anisyl, benzoyl, styryl and benzyl subsets. In the following subsections, six subsets of the validation set is given.

Numbering of the MARs are exactly the same as in the training set, except that the notation starts with “V” instead of “T”. As an example, the 3rd radical in the phenoxy subset of the training set (2-hydroxy-3-vinylphenoxy) is numbered as “V2/3”.

2.2.6 Benzyl/1-Phenylethyl Subset

Figure S13. List of radicals in benzyl subset of the test set.

2.3 Special Cases Set

In the special cases set, there are 20 radicals which are excluded from the training set.

α -styryls can be obtained via hydrogen abstraction from the α -carbon on the vinyl substituent and these radicals prefer an allenic conformation as shown in **Figure S14** (no. **S1/1** to **S1/19**).

"C•C₅H₅=CH₂" refers to α -styryl and double substituted α -styryls are given as (X)C•C₅H₅=CH₂, respectively where X=-OH, -OCH₃, -CHO, -CH=CH₂, -CH₃ or -CH₂CH₃. For instance, ortho hydroxy substituted α -styryl (**S1/2**) is abbreviated as o-(OH)C•C₅H₅=CH₂.

Similarly, the G4 based optimized structure of the o-formylbenzoyl radical (no. **S2/1**) is different than the expected structure where carbonyl group and the formyl group forms a five membered ring.

3. Thermochemical Database

3.1 Thermochemical Database Used In The Training Set

All the thermochemical data obtained used for the derivation of GAVs are NNIs are given in **Table S1** respectively. In these two tables, raw standard enthalpy of formation data ($\Delta_f H^\circ$), BAC-corrected standard enthalpy of formation values ($\Delta_f H^\circ + BAC$), molecular entropy data (S°) intrinsic entropy values (S°_{int}) are given at 298 K whereas C_p values are given at 300 K, 400 K, 500 K, 600 K, 800 K, 1000 K and 1500 K. $\Delta_f H^\circ$ values are given in kJ mol^{-1} and S°_{int} and C_p values in $\text{J mol}^{-1} \text{K}^{-1}$. Total symmetry number (σ_{sym}) and number of optical isomers (n_{opt}) which are important in calculation of intrinsic entropy values from molecular entropy data is also provided. The numbering of the molecules is consistent with the list of molecules given in **Figure S1**.

Table S1. Thermochemical database used as the training set for development of Group Additive Values (GAVs) and non-nearest neighbor interactions (NNIs). The units of standard enthalpy of formation ($\Delta_f H^\circ$) data is given in kJ mol^{-1} whereas the units of entropies (S°) and heat capacities (C_p) are given in $\text{J mol}^{-1} \text{K}^{-1}$.

3.2 Thermochemical Database Of The Special Cases Set

Thermochemical database for the special cases set which include the molecules that are excluded from the training set for development of Group Additive Values (GAVs) and non-nearest neighbor interactions (NNIs) are given in **Table S2**.

Table S2. Thermochemical database for the special cases set. The units of standard enthalpy of formation ($\Delta_f H^\circ$) data is given in kJ mol^{-1} whereas the units of entropies (S°) and heat capacities (C_p) are given in $\text{J mol}^{-1} \text{K}^{-1}$.

Special Cases Set															
#	Radicals	$\Delta_f H^\circ$		S°		$\sigma_{tot\ sym}$	n_{opt}	C_p

4. Bond Dissociation Energies

In this section, the database of Bond Dissociation Energies (BDEs) and the standard enthalpy of formation ($\Delta_f H^\circ$) data used in the calculation of these BDEs are given. The calculation of the BDEs is done according to Eq. 5 described in the Methodology section of the paper.

All the $\Delta_f H^\circ$ data reported in this section of the Supporting Information is calculated with the G4/BAC method described in the Methodology section of the paper. The $\Delta_f H^\circ$ data of the monocyclic aromatic radicals (MARs) are taken from the thermochemical data in **Table S1** and **Table S2**. The standard enthalpy of formation ($\Delta_f H^\circ$) data for the closed-shell monocyclic aromatic hydrocarbons (MAHs) used in the calculation of bond dissociation energies (BDEs) are given in **Table S3**. This data is taken from the study of Ince et al..¹ where the methodology is completely consistent with the present study. The data for the small radicals are given in **Table S4**.

With the aid of the information in these **Tables S1, S2,S3** and **S4**, the database of bond dissociation energies (BDEs) are constructed. This database includes BDE for 297 bonds in 70 MAHs and it is given in **Table S5**. In this table, first, name of the molecule is given and then, the BDEs for all the bonds (available in the database) in that molecule is given one by one. In order to indicate the bond, “-” is used and besides, the smaller moiety of the molecule on one side of the bond is shown in bold. As an instance, C₆H₅-**OH** indicates the bond between ring carbon and the oxygen atom in phenol (C₆H₅OH). In double substituted MAHs, one of the substituents and its position with respect to the other substituent is given in square parenthesis “[ ]”. The other substituent is the substituent which possess the bond of interest and the smaller moiety on the other side of this bond is given in bold. For example, [(m-OH)]C₆H₄O-**CH₃** represents the O-C bond in the methoxy group of the m-methoxyphenol (or m-hydroxymethoxybenzene).

The BDEs of the C₆H₅-X bonds (X=-CH=CH₂, -OCH₃, and -OH) are excluded from the discussion in the text as the trends in these BDEs can only be useful in explaining substituent interactions in MAHs which are already done by Ince et al..¹ In the text, X=-H, -CHO and -CH₃ cases are given as examples, and the information regarding the other excluded groups is given in **Figure S15**.

Table S3. BAC-corrected $\Delta_f H^\circ$ data at the level for G4 for monocyclic aromatic hydrocarbons (MAHs) taken from the study by Ince et al..¹

5. Experimental Validation of G4/BAC Data

Experimental validation of the G4/BAC data is made through the comparison of the BDE values calculated with G4/BAC method with the available experimental data. All the reported experimental BDE data in Luo's handbook and the cited literature²⁻²⁹ are plotted against the G4/BAC data in **Figure S15**. In **Figure S16**, the deviations of the G4/BAC data from the literature values are plotted against G4/BAC data for bond strengths.

Figure S15. Reported experimental BDE data in the literature plotted against G4/BAC data in the present study. Color code (shown on the right) is used to depict the references for the studies from where the data is taken.²⁻²⁹

Figure S16. Plot of the deviation of the G4/BAC data from the reported experimental values for the BDEs of the bonds in monocyclic aromatic hydrocarbons (MAHs) against G4/BAC data.²⁻²⁹

6. The BDE Analysis: Bond Dissociation Energy Plots

The objective of BDE Analysis is to identify substituent interactions in monocyclic aromatic radicals. This analysis uses the change of BDEs upon addition of a substituent group (ΔBDE).

With the following relation, one uses the BDE analysis to identify the substituent effects in the MARs, i.e. $\text{NNI}_{\text{Radical}}$:

$$\Delta\text{BDE} = \text{NNI}_{\text{Parent}} - \text{NNI}_{\text{Radical}} \text{ (refer to text for the derivation of this relation)}$$

Here, the ΔBDEs are calculated in the present study and the $\text{NNI}_{\text{Parent}}$ values are taken from the study of Ince et al.¹ The ΔBDE plots which are not shown in the manuscript are presented in this subsection in **Figure S17**, **Figure S24** and **Figure S26**. In **Figures S18-S22** and **Figures S27-S28**, the BDEs of various bonds are plotted for varying substituent groups.

Figure S17. ΔBDE ($= \text{BDE}_Z - \text{BDE}_H$) for the bonds in substituted $\text{C}_6\text{H}_4\text{-X}$ molecules where $\text{X} =$ (a) $-\text{OH}$, (b) $-\text{OCH}_3$, (c) $-\text{CH}=\text{CH}_2$, (d) $-\text{CH}_3$ and (e) $-\text{CH}_2\text{CH}_3$ for various Z groups. Below each plot, the BDEs of the bonds in unsubstituted MAHs ($\text{BDE}_{(\text{Z}=\text{H})}$) are given. See text for the details regarding the definition of ΔBDEs . Note that the scale of the x-axis differs for the different bonds. All units are kJ mol^{-1} .

Figure S18. BDEs for the bonds in substituted $Z\text{-C}_6\text{H}_4\text{-X}$ molecules with $X=\text{-H}$ (a), -CH_3 (b), and -CHO (c). The average values do not include the unsubstituted case ($Z = \text{H}$). Units are in kJ mol^{-1} .

Figure S19. BDEs of substituted $Z\text{-C}_6\text{H}_4\text{-X}$ molecules with $X=\text{CH=CH}_2$ (a), OH (b), and OCH₃ (c). The average values do not include the unsubstituted case ($Z = \text{H}$). Units are in kJ mol^{-1} .

Figure S20. BDEs for the Z-C₆H₄O-H (trace (a)) and Z-C₆H₄O-CH₃ (trace (b)) bonds in unsubstituted and substituted phenols and anisoles. Trace (c) presents the difference between two traces (a) and (b) corrected by 95 kJ mol⁻¹ (the difference between the Z=H cases). The average values do not include the unsubstituted case (Z = H). Units are in kJ mol⁻¹.

Figure S21. BDE changes for Z-C₆H₄OCH₂-H bonds in substituted anisoles with respect to varying Z groups. The average value does not include the unsubstituted case (Z = H). Units are in kJ mol⁻¹.

Figure S22. BDE changes for Z-C₆H₄C(=O)-H bonds in substituted benzaldehydes with respect to varying Z substituents. The average value does not include the unsubstituted (Z = H) and the outlier case (Z = o-CHO). Units are in kJ mol⁻¹.

Figure S23. Prototypical reactions that yield **a)** α -styryl ($\text{C}_5\text{H}_5\text{C}\bullet=\text{CH}_2$), **b)** ethenylidene-cyclohexadiene, **c)** trans- β -styryl (*t*- β -styryl) and **d)** cis- β -styryl (*c*- β -styryl) radicals.

Figure S24. $\Delta BDEs$ ($= BDE_Z - BDE_H$) for Z -trans- $C_6H_4CH=CH-H$ for 18 different Z groups. Below the plot, the BDE of the bond in unsubstituted styrene ($BDE_{(Z=H)}$) is given. See text for the details regarding the definition of $\Delta BDEs$. Note that the scale of the x-axis differs for the different bonds. All units are kJ mol^{-1} . The $\Delta BDEs$ are given in kJ mol^{-1} .

Figure S25. 3D molecular orbital representation of the substituent interaction in o -OH substituted trans- β -styryl radical.

Figure S26. $\Delta BDEs$ ($= BDE_Z - BDE_H$) for $Z-C_6H_4CH_2-CH_3$ for 18 different Z groups. Below the plot, the BDE of the bond in unsubstituted ethyl benzene ($BDE_{(Z=H)}$) is given. See text for the details regarding the definition of $\Delta BDEs$. Note that the scale of the x-axis differs for the different bonds. All units are kJ mol⁻¹. The $\Delta BDEs$ are given in kJ mol⁻¹.

Figure S27. The variation of BDEs with respect to varying Z groups in cases where (a) Z-cis-C₆H₄CH=CH• (dissociation of the trans C-H bond in styrene) and (b) Z-trans-C₆H₄CH=CH• (dissociation of the cis C-H bond in styrene) is formed. The average values do not include the unsubstituted case (Z = H).

Figure S28. BDE changes for Z-C₆H₄CH₂-H bonds in substituted toluenes with respect to varying Z groups. The average values do not include the unsubstituted case (Z = H).

7. Definition and Physical Origins of the Non-Nearest Neighbor Interactions

The physical origins of the substituent effects in MARs and the definition of these NNIs are given in **Table S6**.

Table S6. Definitions of NNIs for the prediction of thermodynamic properties in MARs and an explanation of the cause of the interaction.

NNI #	Interaction	Contributing physical effects
Anisyl Radicals ($C_6H_4OCH_2\bullet$) + Substituent		
NNI1	$C_6H_4OCH_2\bullet$ — p -OH/OCH ₃	* destabilizing mesomeric effects +M (OCH ₂ •) with +M (OH)
NNI2	$C_6H_4OCH_2\bullet$ — o -CHO	* destabilizing neighboring electron withdrawing groups (-I effects)
NNI3	$C_6H_4OCH_2\bullet$ — o -OCH ₃	* destabilizing anomeric effect (Lone Pair Repulsion)
Phenoxyl Radicals ($C_6H_4O\bullet$) + Substituent		
NNI4	$C_6H_4O\bullet$ — o -OH	* Hydrogen bond * stabilizing mesomeric effects +M (OH) with -M ($C_6H_5O\bullet$)
NNI5	$C_6H_4O\bullet$ — o -OCH ₃	* stabilizing mesomeric effects +M (OCH ₃) with -M ($C_6H_5O\bullet$) * steric interaction
NNI6	$C_6H_4O\bullet$ — m -OCH ₃	* likely a combination of inductive and electrostatic effects because the orientation of the OCH ₃ group is crucial
NNI7	$C_6H_4O\bullet$ — p -OH/OCH ₃	* stabilizing mesomeric effects +M (OH/OCH ₃) with -M ($C_6H_5O\bullet$)
NNI8	$C_6H_4O\bullet$ — o -CHO	* steric interaction * destabilizing mesomeric effects -M (CHO) with -M ($C_6H_5O\bullet$)
NNI9	$C_6H_5O\bullet$ — m -CHO	* destabilizing inductive effects -I (OCH ₃) with -I ($C_6H_5O\bullet$)
NNI10	$C_6H_4O\bullet$ — o -CH=CH ₂	* destabilizing steric interaction * stabilizing mesomeric effects +M (CH=CH ₂) with -M ($C_6H_5O\bullet$)
NNI11	$C_6H_4O\bullet$ — p -CH=CH ₂	* stabilizing mesomeric effects +M (CH=CH ₂) with -M ($C_6H_5O\bullet$)
NNI12	$C_6H_4O\bullet$ — o -CH ₃ /CH ₂ CH ₃	* hyperconjugation
NNI13	$C_6H_4O\bullet$ — p -CH ₃ /CH ₂ CH ₃	* hyperconjugation
Benzoyl Radicals ($C_6H_4C\bullet=O$) + Substituent		
NNI14	$C_6H_4C\bullet=O$ — o -OH	* stabilizing mesomeric effects +M (OH) with -M (C•=O) * H-bond
NNI15	$C_6H_4C\bullet=O$ — p -OH/OCH ₃	* stabilizing mesomeric effects +M (OH) with -M (C•=O)
NNI16	$C_6H_4C\bullet=O$ — o -OCH ₃	* destabilizing anomeric effect (Repulsion between lone pair and single electron on (C•=O))
NNI17	$C_6H_4C\bullet=O$ — m -CHO	* destabilizing inductive effects

		-I (CHO) with -I (C•=O) similar to m-CHO—CHO ¹
NNI18	C ₆ H ₄ C•=O — <i>p</i> -CHO	* destabilizing inductive effects -I (CHO) with -I (C•=O) * destabilizing mesomeric effects -M (CHO) with -M (C•=O)
NNI19	C ₆ H ₄ C•=O — <i>o</i> -CH=CH ₂	* weak steric interaction * destabilizing mesomeric effects -M (CH=CH ₂) with -M (C•=O)
Styryl Radicals (C₆H₄CH=CH•) + Substituent		
NNI20	trans-C ₆ H ₄ CH=CH• — <i>o</i> -OH	* 3-center, 3-electron bond (O-H---C•)
NNI21	trans/cis-C ₆ H ₄ CH=CH• — <i>o</i> -CHO	* steric interaction
NNI22	trans/cis-C ₆ H ₄ CH=CH•) — <i>o</i> -CH=CH ₂	* steric interaction
NNI23	trans/cis-C ₆ H ₄ CH=CH•) — <i>o</i> -CH ₃ /CH ₂ CH ₃	* steric interaction
NNI24	cis-C ₆ H ₄ CH=CH•	* cis correction
Benzyl (C₆H₄CH=CH•)/ 1-Phenylethyl Radicals (C₆H₄C•HCH₃) + Substituent		
NNI25	C ₆ H ₄ CH ₂ •/C ₆ H ₅ C•HCH ₃ — <i>p</i> -CH=CH ₂	* stabilizing mesomeric effects -M (CH=CH ₂) with +M (C ₆ H ₅ C•)
NNI26	C ₆ H ₄ CH ₂ •/C ₆ H ₅ C•HCH ₃ — <i>o</i> -CH=CH ₂	* steric interaction preventing resonance
NNI27	C ₆ H ₄ CH ₂ •/C ₆ H ₅ C•HCH ₃ — <i>p</i> -CHO	* stabilizing mesomeric effects -M (CHO) with +M (C ₆ H ₅ C•)
NNI28	C ₆ H ₄ CH ₂ •/C ₆ H ₅ C•HCH ₃ — <i>o</i> -CHO	* steric interaction
NNI29	<i>o</i> -C ₆ H ₄ CH ₂ •—CH ₃ /CH ₂ CH ₃ <i>o</i> -C ₆ H ₄ CH•CH ₃ —CH ₃ /CH ₂ CH ₃	* steric interaction restricting internal rotation * hyperconjugation

8. Initial Determination of GAV and NNI Parameters

As described in the paper, the GAV and the NNI parameters are determined simultaneously based on a least squares linear regression minimization procedure of the differences between Group Additivity calculations and the first principles data for the reference thermochemical database that possess 316 MARs. The NNIs that account for the substituent interactions between nonradical substituents are defined by Ince et al. and they are given in **Table S7**.

The GAVs and the NNIs that are obtained from the linear regression are tabulated in **Table S8** and **Table S9**, respectively. The statistics of the linear regression is given in **Table S10**.

Table S7. NNIs taken from Ince et al. that are required for the NNIs in substituted MAHs.¹

NNIs of Nonradical Substituent Interactions	$\Delta_f H^\circ$	S°	C_p [J mol ⁻¹ K ⁻¹]

9. Thermochemical Data Of The Validation Set

The transferability of the preliminary GAV/NNI parameters (See **Table S7** and **Table S8**) to the MARs outside the training set are tested on a set of 53 triple and quadruple substituted MARs (See **Figures S8-S13**). The thermochemical data for the validation set is given in **Table S11**.

The NNI parameters defined for the MARs bring a significant improvement to the GA based predictions which can be seen in **Table S12**. In this table, GA predictions with and without NNI_{Radical} parameters are given. Below the table, there is a statistical comparison of these two cases where the sharp decrease in deviations upon the addition of NNIs can be seen.

Table S11. Thermochemical database used as the validation set for the preliminary Group Additive Values (GAVs) and non-nearest neighbor interactions (NNIs). The units of standard enthalpy of formation ($\Delta_f H^\circ$) data is given in kJ mol^{-1} whereas the units of entropies (S°) and heat capacities (C_p) are given in $\text{J mol}^{-1} \text{K}^{-1}$.

^[a] The ab-initio and the GA based thermochemical databases for the validation set is given in **Table S11** of the Supporting Information.

^[b] The full names and the numbering of the MARs in the validation set are described in Section 2.2 of the Supporting Information. In order to avoid any confusion, the depictions of these MARs are also given in **Figures S8-S13** of the Supporting Information.

^[c] This term includes GA predictions based on the GAVs for the closed and open shell groups and the NNIs that describe the interactions between non-radical groups which are defined by Ince et al.¹ and excludes the NNIs that are defined in this paper.

10. Deviations between GA and Ab-Initio Calculated Datasets

The GAVs and the NNIs for the heat capacities (C_p) at 400 K, 500 K, 600 K, 800 K, 1000K and 1500K are given along with their 97.5% confidence intervals in **Table S13** and **Table S14**, respectively. In **Table S15**, the deviations between Group Additivity (GA) and ab-initio based data for the final thermochemical database is given for the full database (369 MARs). The histograms for the differences between two datasets for $\Delta_f H^\circ$ and S° at 298K and C_p at various temperatures (300K, 400K, 500K, 600K, 800K, 1000K and 1500K) are given in **Figure S29**, **Figure S30** and **Figure S31**, respectively.

Table S13. GAVs for heat capacity (C_p) at various temperatures for the MARs of the final database. The standard deviations relate to 97.5% confidence intervals.

GAVs	C_p [J mol ⁻¹ K ⁻¹]					
	400 K	500 K	600 K	800 K	1000 K	1500 K
$\dot{C}_b$	14.7 ± 0.67	16.4 ± 0.64	17.7 ± 0.64	19.4 ± 0.66	20.5 ± 0.61	21.3 ± 0.47

Table S15. Differences between group additively and ab-initio calculated values for standard enthalpy of formation ($\Delta_f H^\circ$), entropy (S°) and heat capacity (C_p) of the final dataset of MARs. Standard enthalpies of formation ($\Delta_f H^\circ$) are given in kJ mol^{-1} , whereas entropies (S°) and heat capacities (C_p) are in $\text{J mol}^{-1} \text{K}^{-1}$.

Group additivity calculated (GA) - Ab-Initio calculated values (AI)
